

Liquid Copper Fungicide

CONTROLS:

Damp warm weather brings bacteria and fungi issues that cause leaf spots, rust, and blights. Vascular diseases are caused by fungal and bacterial pathogens that invade the transport tissues of your plants. As these pathogens multiply, they clog the vascular tissues, making it difficult or impossible for some parts of your plant to get nutrients, water and send manufactured food back to the crown. All of this blockage will eventually cause the death of tissues, and tender new growth is usually the most susceptible since it's the furthest from the roots.

DIRECTIONS FOR USE

Even though our Copper Fungicide is not OMRI rated, it contains the same ingredients of many of the Organic Labeled products. It works and it is important to follow the label instructions. Keep people and pets away until the liquid has dried on the leaf. Follow the label instructions. Shake well before using.

INFORMATION

The control of diseases with fungicides is based on PREVENTION: Apply early in the disease cycle. All plant surfaces must be completely covered with the fungicide to successfully prevent infection.

Copper pesticides are considered preventative, not curative of plant diseases. Use the highest indicated rate per crop when disease incidence is high or expected to be, depending on rainfall and temperature. The lower rate is suitable for general preventive sprays under normal conditions.

PRODUCT INSTRUCTIONS

Partially fill the spray tank/container with water, add the desired amount of Liquid Copper Fungicide and continue filling the tank/container. If applied with other products, add Liquid Copper Fungicide last. Agitate the tank during mixing and application, until tank is empty. A plastic or metal stirring stick should provide adequate agitation. Observe all cautions and limitations on labeling of all products used in mixtures. Start with clean equipment. Equipment should be flushed well with water after use.

APPLICATION:

Vegetables:

Follow Manufactures' Mixing and Application Instructions. Liquid Copper Fungicide can be applied to the plants in using the same tank that Thuricide Bt is mixed in.
